Case studies

A complex double crane collapse results in saving millions

SITUATION

When two 400 ton crawler cranes performed a tandem lift to position an Offshore Supply Vessel during construction, they pulled each other over, resulting in a collapse of a 31,000 square foot machine shop building.

SCENARIO

The USD 22 million claim covered physical damage to scheduled / unscheduled equipment, building, personal property, stock, time element, builder's risk, pollution, containment, and salvage disposition to name a few.

OUTCOME

The outcome resulted in a litigation-free settlement, reduced by over USD 4.5 million against original loss estimate.

Coal mine loss avoids complete destruction

SITUATION

A manually operated armored face conveyor (AFC), a 110 ton shearer, and a 30 ton chock were crushed at a depth of -1,200 feet below the surface in a coal mine in the Appalachians when the shearer hit a seam fault. What resulted was a collapse of the outermost end of the AFC from the pressing weight.

SCENARIO

Although operators safely escaped, the damage required miners to manually dig in order to reach the fault and then pass coal back through buckets in order to reach the AFC. The equipment was disassembled and pulled out through the passageway.

OUTCOME

The USD 21 million claim covered physical damage, time element, as well as sue and labour expenditures. The claim stayed out of litigation and once closed, resulted in over USD 1.75 million savings in time element.
